Item Package Specification

for

SmarterApp Assessment System

American Institutes for Research

Revision History

Revision Description	Author/Modifier	Date
0.1 - Initial Release	Rami Levy David Lopez de Quintana	March 7, 2014
0.2 - Added example manifest file in Appendix A	David Lopez de Quintana	March 18, 2014
0.3 - Updated to use latest IMS QTI latest shared stimulus type and manifest file	David Lopez de Quintana	May 5, 2014
0.4 - Added provisions for support of non-smarterAppMetadata metadata	David Lopez de Quintana	July 23, 2014
0.5 – Added support for multiple standards publications and changed item statistics to be more general	David Lopez de Quintana	November 19, 2014
0.6 – Added resource link to the Item Metadata Spec on SmarterApp, updated folder naming convention, updated sample imsmanifest.xml to include illustration glossary dependency	Alex Dean	January 24, 2017
0.7 – Added dependencies to braille transcript files [note: sample imsmanifest files only includes a handful of braille transcript file dependencies, intended as a representation]. Updated braille file naming.	Alex Dean	May 5, 2017

Purpose

The purpose of this document is to provide an item package specification that will be used for Smarter Balanced Assessment Consortium item packages. This specification will be the combined work of various vendors working on Smarter Balanced contracts and Smarter Balanced personnel.

The American Institutes for Research representing Contract 11 Test Delivery System will petition IMS Global to create a Smarter Balanced item package profile based on this specification.

Item Package Folder Structure

The packaging of items and item assets follows the standards for item packaging described in references 1 and 2 above, but deviate from the standards in the following ways:

- The format of the items themselves may be compliant with APIP, QTI or SmarterApp item specifications.
- This folder structure refers to a stimulus as a first-class entity that is a peer to, but distinct from an item. IMS Global has agreed to adopt item stimuli as first class entities, but this is not yet reflected in the standard.
- Item and stimulus metadata will be contained in a separate metadata file asset that is a dependency of the item or stimulus resource. In the current standard, metadata is stored in the manifest file itself or in the item XML itself. Moving this to a separate metadata XML keeps the item XMLs lightweight, and makes the content of manifest files specific to a particular item or stimulus. IMS Global has also agreed to adopt the use of external metadata files, but have not updated the standards at the time of this writing.
- This specification uses new or updated values for the type attribute of the resource tag in the item manifest that reflects the additions to the standards described above.

The following describes the structure of the SmarterApp profile of item packages:

- Package manifest file named **imsmanifest.xml**
- One folder named **Items** containing all items as described below:
  - One (sub)folder per item and its associated resources (multimedia, metadata)

4

- o Item folder's name begins with **Item-** followed by the item identifier
- o Following the item folder's prefix is the item bank id (ex: 200-)
- o Following the item bank id is the item id (ex: 12345)
- o All files within the **Item-** folder use the same item identifier in their filename.
- One folder named **Stimuli** for all Stimuli containing all stimuli as described below:
  - o One (sub)folder per stimulus and its associated resources (multimedia, metadata)
  - o Stimulus folder's name begins with **stim-** followed by the stimulus identifier
  - o Following the folder name prefix is the stim bank id (ex: 200-)
  - o Following the stim bank id is the stim id (ex: 123)
  - o All files within the **Stim-** folder use the same stimulus identifier in their filename.
- *Optionally*, a folder for local XSDs named **LocalXSDs**
- *Optionally*, a folder for common resources named **CommonResources**

The package including all files and folders will be zipped using the standard zip file format. The following diagram illustrates the package structure.
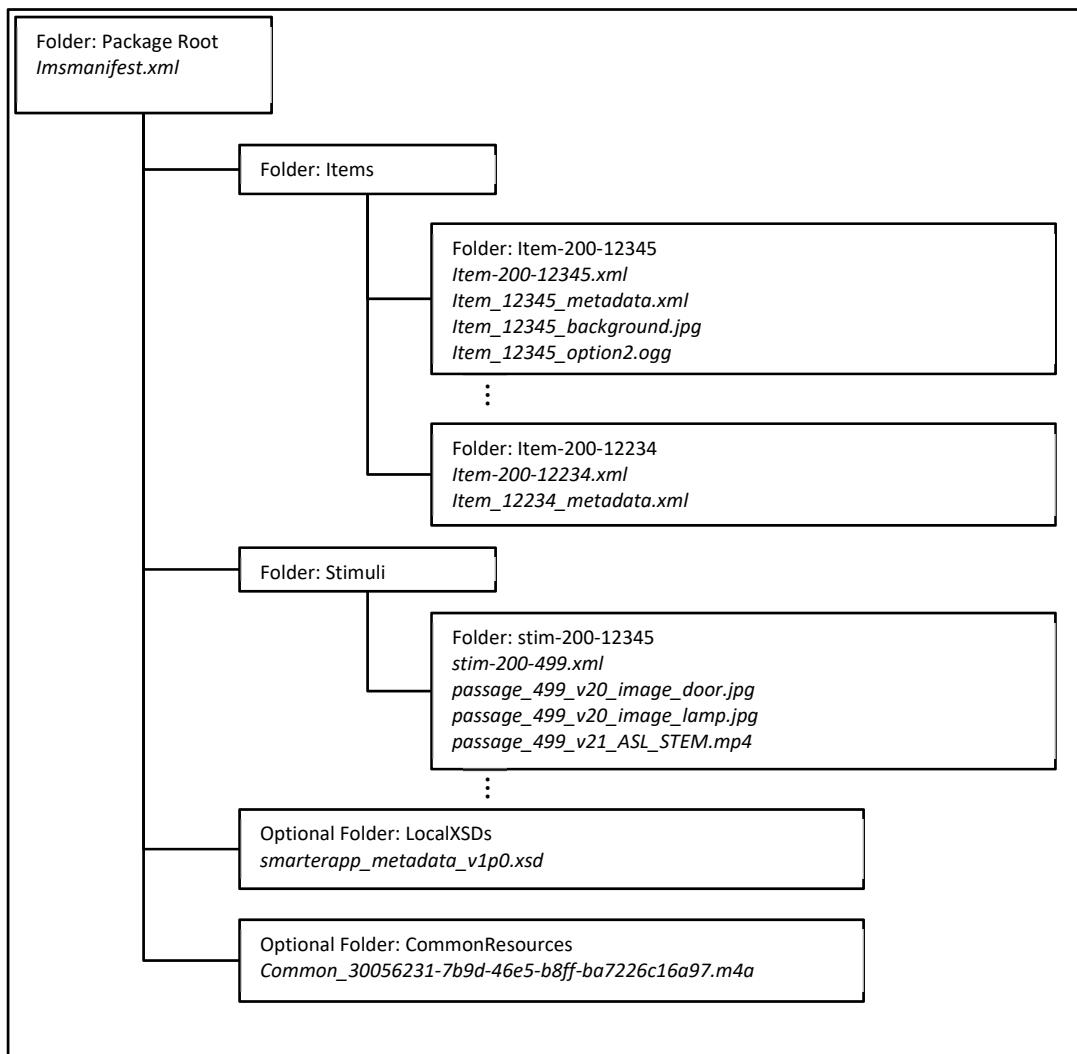

Figure 1. Item Package Structure

Item Package Manifest File (imsmanifest.xml)

This section provides additional details regarding the package manifest file (imsmanifest.xml). The manifest file conforms to the standards in references 2 and 3 with the key exception that stimuli are first class entities that are peers to items, and metadata files are provided for each item or stimulus resource.

The following table indicates the new or updated types used in the type attribute of the resource tag in the manifest file.

Resource Type	Description
imsqti_apipitem_xmlv2p2	Updated type for item resource
imsqti_apipstimulus_xmlv2p2	New type for stimulus resources
resourcemetadata/apipv1p0	New type for metadata resources
associatedcontent/apip_xmlv1p0/learning-application-resource	Existing type used for all other item or stimulus assets

Table 2. Values for Type Attribute for Manifest File Resources

Items are usually, but not always, associated with assets such as graphics, Braille files or audio/video files. We can express this graphically.
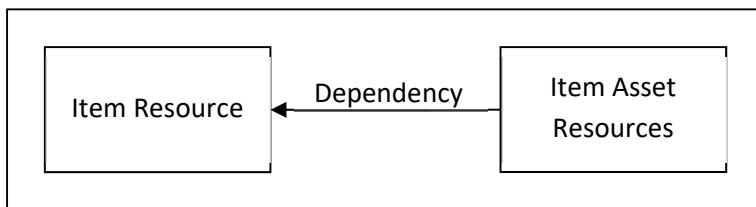

Figure 2. Dependency Relationship between Items and Item Assets

Stimuli are also first class entities that are peers to items, and can have associated assets as well. This is expressed graphically in a similar manner.
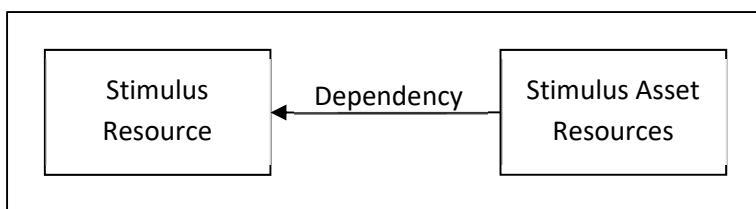

Figure 3. Dependency Relationship between Stimuli and Stimulus Assets

Items can be related to stimuli. Typically, multiple items are related to one or more stimuli. This is expressed as a dependency relationship between the item resource and the stimulus resource. This is expressed graphically as follows.
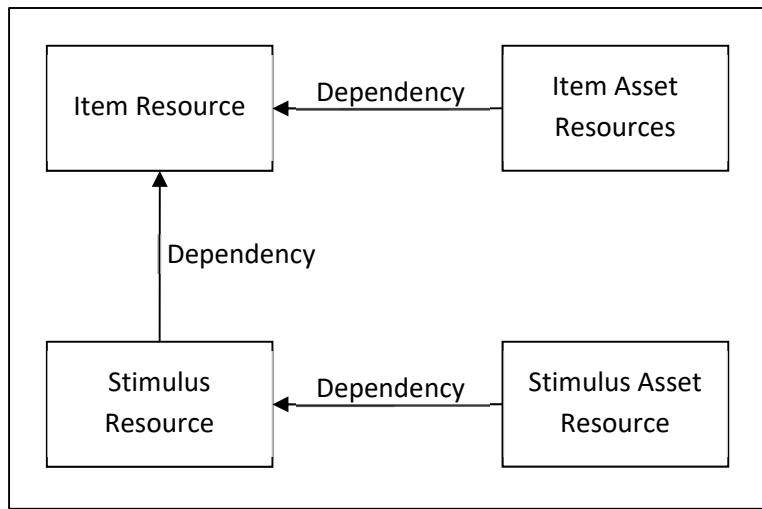

Figure 4. Dependency Relationships between Items and Stimulus Resources

In addition to dependent stimuli, item resources can have dependencies to other item resources such as Wordlist or Tutorial items. We can express this graphically as follows.
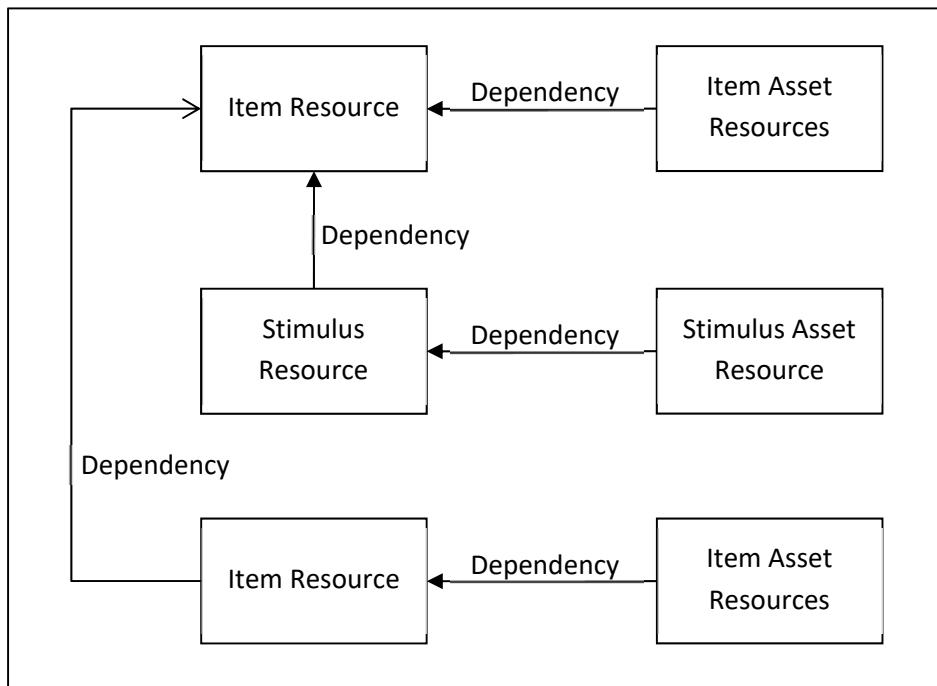

Figure 5. Dependency Relationships between Items, Other Items, and Stimulus Resources

The manifest file contains the following elements:

Element	Parent Element	Description
manifest	None	Main container element
metadata	manifest	Schema, schemaversion, and other test-level metadata should be placed here
organizations	manifest	An organizations element is required even if empty
resources	manifest	This is the main container element for all resources
resource	resources	Item, stimulus, metadata, and asset resources appear as individual resources
file	resource	This is the element that indicates the file location of the parent resource
dependency	Resource	The dependency element indicates that this item is dependent on other resources. This may be other items, stimuli, metadata or other types of assets

Table 3. Required Manifest Elements

The following XML snippets illustrate these usage patterns. First, the base item resource describes a resource of type "imsqti_apipitem_xmlv2p1" with dependencies on:

- A Braille file asset resource
- A video file asset resource
- A metadata file resource
- A stimulus resource
- A Wordlist item
- An illustration glossary resource

We first declare an item resource with dependencies on Braille and a video file, a metadata file, a stimulus and a Wordlist file.

```xml
<!-- item resource -->
<resource identifier="item-187-545" type="imsqti_apipitem_xmlv2p2">
  <!-- file child element references item XML file location -->
  <file href="Items/Item_545/item-187-545.xml" />
  <!-- dependency declaration for a Braille file (item asset) -->
  <dependency identifierref="item_545_enu_ecl_brf" />
  <dependency identifierref="item_545_enu_ecl_transcript_brf" />
  <!-- dependency declaration for a video file (item asset) -->
  <dependency identifierref="Item_545_ASL_STEM" />
  <!-- dependency declaration for a metadata file resource -->
  <dependency identifierref="item-187-545_metadata" />
  <!-- dependency declaration for stimulus resource -->
  <dependency identifierref="stim-187-3554" />
  <!-- dependency declaration for wordlist resource -->
  <dependency identifierref="item-187-801" />
  <!-- dependency declaration for illustration glossary resource -->
  <dependency identifierref="speeding" />
</resource>

<!-- Braille file resource from item dependency declaration -->
```

```xml
<resource identifier="item_545_enu_ecl_brf"
type="associatedcontent/apip_xmlv1p0/learning-application-resource">
  <file href="Items/Item_545/item_545_enu_ecl.brf" />
</resource>
<resource identifier="item_545_enu_ecl_transcript_brf"
type="associatedcontent/apip_xmlv1p0/learning-application-resource">
  <file href="Items/Item_545/item_545_enu_ecl_transcript.brf" />
</resource>

<!-- video file resource from item dependency declaration -->
<resource identifier="Item_545_ASL_STEM"
type="associatedcontent/apip_xmlv1p0/learning-application-resource">
  <file href="Items/Item-545/Item_545_ASL_STEM.mp4" />
</resource>

<!-- metadata file resource from item dependency declaration -->
<resource identifier="item-187-545_metadata"
type="resourcemetadata/apipv1p0">
  <file href="Items/Item-545/item-187-545_metadata.xml" />
</resource>

<!-- illustration glossary resource from item dependency declaration -->
<resource identifier="speeding"
type="associatedcontent/apip_xmlv1p0/learning-application-resource">
  <file href="Items/Item-187-1001644/speeding.svg" />
</resource>
```

Next we show the stimulus resource that the item for which the item has a dependency. The stimulus resource also has a dependency on a graphics file and a metadata file, and resource for each are declared after the stimulus file.

```xml
<!-- stimulus resource -->
<resource identifier="stim-187-3554" type="imsqti_apipstimulus_xmlv2p2">
  <!-- file child element references item XML file location -->
  <file href="Stimuli/Stim_3554/stim-187-3554.xml" />
  <!-- dependency declaration for a graphics file (stimulus asset) -->
  <dependency identifierref="Passage_3554_v11_Image_15886_png256" />
  <!-- dependency declaration for a metadata file resource -->
  <dependency identifierref="stim-187-3554_metadata" />
</resource>

<!-- graphics file resource from item dependency declaration -->
<resource identifier="Passage_3554_v11_Image_15886_png256"
type="associatedcontent/apip_xmlv1p0/learning-application-resource">
  <file href="Stimuli/Stim_3554/Passage_3554_v11_Image_15886_png256.png"
/>
</resource>

<!-- metadata file resource from item dependency declaration -->
<resource identifier="stim-187-3554_metadata"
type="resourcemetadata/apipv1p0">
  <file href="Stimuli/Stim_3554/stim-187-3554_metadata.xml" />
</resource>
```

Finally, the Wordlist item resource for which the item has a dependency is declared along with its own metadata file dependency.

```xml
<!-- wordlist item resource -->
<resource identifier="item-187-801" type="imsqti_apipitem_xmlv2p2">
  <!-- file child element references item XML file location -->
  <file href="Items/Item_801/item-187-801.xml" />
  <!-- dependency declaration for a metadata file resource -->
  <dependency identifierref="item-187-801_metadata" />
</resource>

<!-- metadata file resource from item dependency declaration -->
<resource identifier="item-187-801_metadata"
type="resourcemetadata/apipv1p0">
  <file href="Items/Item_801/item-187-801_metadata.xml" />

</resource>
```

See Appendix A for a complete example of a manifest file.

Item or Stimulus Metadata Structure

This section describes the format of a SmarterApp item or stimulus metadata file. All SmarterApp-specific metadata fields should conform to the following naming guidelines:

- Strict UpperCamelCase
- No dashes, spaces, or punctuation
- Metadata declared as multivalued simply repeats the metadata declaration for each value
- The metadata file structure is flat with the exception of the IrtDimension element which is hierarchical
- All metadata included in this specification must be a child element of the smarterAppMetadata element (see below)
- All metadata that is not referenced in this specification must be provided after the smarterAppMetadata element
- No provisions for hierarchical non-SmarterApp metadata is provided by this specification; all non-SmarterApp metadata is by definition a list of single or multivalued "flat" elements
- SmarterApp components will ignore any hierarchical non-SmarterApp metadata provided after the smarterAppMetadata element

Please see the Item and Stimulus Metadata Specification for SmarterApp Assessment System (reference 3) for more information about the specific SmarterApp metadata fields. This document will limit itself with the structure of the metadata file. Please note that if non-required metadata is not available or there are no values for it, it is not necessary to supply an empty metadata field. Only supply values for required metadata and for non-required metadata for which there are non-whitespace values available.

The following table describes the structure of a sample item or stimulus metadata file.

Item Standards Alignment

The SmarterApp system relies on item alignments to particular standards that come from a one or more standards publication. These standards publication are hosted in the Core Standards component, and are consumed by Item Authoring and Test Authoring.

Allowing more than one standards publication is necessary because standards publications can be updated by creating a new version, or changed significantly when states review their educational standards. Another canonical use for multiple standards publication is to use a simple "undesignated" standards publication when field testing items, then a standard from an actual standards publication when the item is promoted to operational use. This simplifies test construction and allows dual use of an item during its lifecycle.

Item Authoring systems allow the user to browse standards data from one or more standards publications and select one standard as the primary standards alignment for the selected publication and zero or more standards as the secondary standards alignment(s).

Test Authoring allows the user to select standards publications against which the test blueprint will be created. Items that are aligned to the standards publication in question can be selected for placement on adaptive item pools and/or test form partitions. The primary alignment for the selected publication will be used for search and selection of items. Only one standards publication can be selected for test creation. If an item is aligned to more than one standards publication, Test Authoring will only consider the standards alignment for the selected standards publication.

Item Statistics

Item statistics are stored in IrtDimension elements in the item metadata XML file. The latest version of the IrtDimension parameter keeps the IrtDimensionPurpose, IrtModelType, IrtScore and IrtWeight elements, but expands the IRT parameters into their own IrtParameter sub-elements. The IrtParameter sub-element contains Name and Value sub-elements allowing more flexibility in the naming of the specific IRT parameters. Allowing flexible naming of the IRT parameters eliminates ambiguity about which IRT parameter is being described.
